

Yankee Doctor Service

Yankee doctors operating at maximum efficiency is crucial to the success of any tissue operation, and also the goal of the service technician performing the Yankee doctor service. Our qualified service technicians bring with them over 75 years of doctoring experience in the tissue industry.

A typical Yankee doctor service will include physical inspection of all mechanical components of each doctoring system including: mounting brackets, bearings, journals, doctor structure, blade holder, levers, air cylinders, oscillation, and other equipment. The blade angle will be adjusted to your specific application. The holder profile is checked and necessary adjustments are made to ensure a proper blade-to-surface fit.

The full report, which is submitted once service is completed, includes service details, before and after profile diagrams, and recommendations for improved performance.

Overview

Features

- Inspection of all mechanical components
- Check blade angle and adjust doctor as necessary
- Perform blade holder profile
- Detailed service report included

Benefits

- Maintain consistent product quality
- Improve up-time
- Reduce loading pressure
- Increase blade and Yankee life
- Documentation of equipment history

Dial indicator profiling holder to Yankee surface.
