

EzKleen™ V Roll Polisher

Doctor blades are used to remove contaminants and other matter from roll surfaces. Over time, the build-up on the roll surface requires additional cleaning to provide more uniform roll surface conditions.

The EzKleen V roll polisher safely and effectively removes build-up from roll surfaces without costly surface regrinds or special release coatings, and is designed for machines producing grades for porous roll surfaces that require specialized surface cleaning and conditioning. Using the EzKleen V roll polisher during regularly scheduled downtime has been shown to improve the condition of the roll surface. It conveniently fits into most conventional roll cleaners and incorporates application specific cleaning pads for cleaning and polishing the surface of any roll on the production line.

The device is compact and easy to handle. Any pad material can be used by simply adhering it to the fastener on the EzKleen V roll polisher shoe.

Overview

Features

- Easy installation and removal
- Replaceable cleaning pads
- Application-specific pads available
- Accommodates any roll diameter

Benefits

- More uniform roll surface conditions
- Maintains roll surface finish (Ra)
- Increase heat transfer
- Reduce the need for off-machine roll conditioning
- Safe operation requiring limited or no manpower
